- | Allows creation of New Shipping & Delivery Information.

## INTEGRATION

## OVERVIEW

The Shipping module is responsible for all parts being shipped from the facility to outside locations as well as those parts moving within the facility. The module is a combination of deliveries and shipments. These two types are separated by different tabs in the shipping module. The deliveries represent any movement of a part within the facility. All parts moved from inventory to a Work Order, Inventory to Shipping, Receiving to a Work Order and even Receiving to Shipping is done through the delivery portion of the Shipping module. All parts that are sent to customers as Rentals or Sales Order purchases and Work Order components completed and being returned to the customer are done through the shipping portion of the Shipping module.

All deliveries and shipments are numbered and tracked within CORRIDOR. Reports can be printed to display all shipments for certain customers and dates or display all shipments made.
